## Dataset Description

Eelgrass Climate Impacts

Experimental conditions, growth and survival of eelgrass

Counts of all shoots in each tray in each tank

Experiment codes refer to specific populations and plantings:

Experiment Code	Start Date	Population
1	May 2013	South Bay, Virginia Transplants
2	April 2013	Dumas Bay, Washington
3	April 2013	Nisqually Landing, Washington
4	April 2013	False Bay, Washington (seeds)
5	April 2013	South Bay, VA nutrient manipulations
7	December 2013	South Bay, Virginia (re-planting)
8	May 2014	Dumas Bay, Washington
9	May 2014	Nisqually Landing, Washington
10	May 2014	South Bay, Virginia
11	May 2014	South Bay, VA nutrient manipulations (whole)
12	May 2014	South Bay, Virginia (pH 6.5 re-planting)
13	May 2014	South Bay, VA (DOC)
14-21	May 2014	South Bay, VA nutrient manipulations (NE)

## Methods & Sampling

**Shoot counts** were measured by counting all shoots in each tray in each tank. Shoot count represents all shoots (vegetative + flowering) in each tray. Flowering shoots were distinguished from vegetative shoots and counted separately. Experiment codes refer to specific populations and plantings.

Experiment Code	Start Date	Population
1	May 2013	South Bay, Virginia Transplants
2	April 2013	Dumas Bay, Washington
3	April 2013	Nisqually Landing, Washington
4	April 2013	False Bay, Washington (seeds)
5	April 2013	South Bay, VA nutrient manipulations
7	December 2013	South Bay, Virginia (re-planting)
8	May 2014	Dumas Bay, Washington
9	May 2014	Nisqually Landing, Washington
10	May 2014	South Bay, Virginia
11	May 2014	South Bay, VA nutrient manipulations (whole)
12	May 2014	South Bay, Virginia (pH 6.5 re-planting)
13	May 2014	South Bay, VA (DOC)
14-21	May 2014	South Bay, VA nutrient manipulations (NE)

## Data Processing Description

**Shoot counts** - represent absolute shoot numbers, no processing was performed on the data reported in this file.

### BCO-DMO Processing Notes

- Generated from original file: "BORG\_SeaGrass\_Full\_data\_Records.xlsx" Sheet: "Counts" contributed by David Ruble
- Approx Lat/Lon of Virginia Aquarium Climate Change Facility appended to enable data discovery in MapServer
- Parameters modified to conform to BCO-DMO parameter naming conventions ([Choosing a Parameter Name](#))

## Data Files

File
<b>Shoot_Counts_Data.csv</b> (Comma Separated Values (.csv), 130.31 KB) MD5:4e48d058f365cbff626dc3712a1c1cfe Primary data file for dataset ID 505038

[ [table of contents](#) | [back to top](#) ]

---

## Parameters

Parameter	Description	Units
Lab_Id	Lab Id – Lab identifier where experiments were conducted	text
Lat	Approximate Latitude Position of Lab; South is negative	decimal degrees
Lon	Approximate Longitude Position of Lab; West is negative	decimal degrees
date	Date	yyyymmdd
Experiment_Code	Experiment Code – Populations and Plantings (see Dataset Description and Acquisition Description for Experiment Code key)	dimensionless
Tank	Tank	dimensionless
pH_Target	PH Target	pH
Tray	Tray	dimensionless
vegShootCount	Vegetative Shoot Count	number counted
flwShootCount	Flowering Shoot Count	number counted

## Project Information

### Impact of Climate Warming and Ocean Carbonation on Eelgrass (*Zostera marina* L.) (Impact of Climate on Eelgrass)

**Website:** <http://sci.odu.edu/oceanography/directory/faculty/zimmerman/researchpage/index.shtml>

**Coverage:** Virginia Beach, VA and Southern Chesapeake Bay region 36° 49' 32.84" N 75° 58' 58.17" W

*Project abstract from the NSF proposal:*

The past few decades have accumulated mounting evidence of profound anthropogenic effects on fundamental biogeochemical processes across the planet, especially in coastal environments that support a diverse array of highly productive ecosystems including coral reefs, seagrass meadows, and estuaries. The ecological significance of seagrasses is largely due to the remarkable degree of adaptation they exhibit to a submerged aquatic existence. Despite numerous successful adaptations, however, seagrasses have high light requirements that make them vulnerable to anthropogenic disturbances. The paradoxical vulnerability results largely from their high reliance on dissolved aqueous CO<sub>2</sub> for photosynthesis. The potential for rising atmospheric CO<sub>2</sub> concentrations to have significant warming impacts on the global climate has long been

recognized, but the potential impacts of the "other CO<sub>2</sub> problem", also known as ocean acidification, have only recently begun to be appreciated. As with other impacts of climate change, the increased concentrations of dissolved aqueous CO<sub>2</sub> [CO<sub>2</sub> (aq)] in the oceans of the world will elicit both negative and positive responses among organisms, ultimately potentiating ecological losers and winners. This project will explore the response of eelgrass to increased CO<sub>2</sub> (aq) within the context of a warming coastal ocean using a combination of manipulative experiments, physiological/biochemical investigations and mathematical modeling. The investigators hypothesize that rising CO<sub>2</sub>(aq) will increase the high temperature tolerance of plants by improving the Q<sub>10</sub> response of photosynthesis relative to respiration, thereby leading to higher growth rates, improved survival of vegetative shoots at high temperature, and even flowering output and seed production. This project will investigate the key relationships between environmental parameters that have both negative (ocean warming) and positive (ocean carbonation) impacts on the light requirements and dynamics of carbon balance in these critically important marine angiosperms. By focusing on Chesapeake populations growing near the southern limit of eelgrass distribution on the Atlantic coast, the investigators will gain predictive insight into how climate change may alter the geographic distribution of this critically important species in other coastal environments that may be subjected to less temperature stress but similar levels of ocean carbonation.

**Objectives:** The overall goal of the proposed research will be to develop a predictive mechanistic understanding of the simultaneous impacts of water temperature, [CO<sub>2(aq)</sub>] and [HCO<sup>3-</sup>] on the photosynthetic metabolism, vegetative growth and reproductive success of *Zostera marina* L. We will address the following questions, (1) To what extent is the upper thermal limit of eelgrass controlled by CO<sub>2(aq)</sub> availability, (2) Will prolonged CO<sub>2(aq)</sub> enrichment affect the ability of eelgrass to utilize HCO<sup>3-</sup> for photosynthesis, (3) Does prolonged CO<sub>2(aq)</sub> enrichment increase seed production and viability, and (4) Does CO<sub>2(aq)</sub> enrichment affect nutritional quality of seagrass tissue, particularly C:N ratios and protein content?

These experiments will be carried out at an experimental CO<sub>2(aq)</sub> enrichment facility which is being constructed at the [Virginia Aquarium & Marine Science Center](#), adjacent to Owl Creek and Rudee Inlet, in Virginia Beach, VA.

## Data Inventory

- 1) Weather and hydrographic data for Owl Creek Experimental Facility. Metadata and time series observations of irradiance, water temperature, pH, salinity, alkalinity, CO<sub>2</sub> and dissolved nutrients will be posted on our web site, and final version data will be supplied to NODC for permanent archive.
- 2) Experimental metadata from the tanks (pH, temperature, eelgrass abundance and survival, growth rates, metabolic rates, etc.) will also be posted on our website listed above. Final data will be supplied to NODC and/or other databases as appropriate and as they become available.

Project data will also be contributed to thematic databases, including SeaBASS operated by NASA, WOOD operated by ONR, as well as NODC.

Preliminary results may be posted at the group's Web site hosted at ODU:
