Dataset Description

This data set is from an experiment that varied the total amount of food present and the proportion of that food that was animal or algal tissue in the diet. We maintained crabs on the same diet for 8 weeks, after which we quantified their reproductive effort and physiological condition.

Methods & Sampling

Crabs were maintained in a recirculating aquarium in conditions that reflected those of their collection site in the fall (temperature: 13 degrees C and salinity: 33–34 ppt). Each crab was maintained in an individual experimental chamber that was submerged in the recirculating aquarium. Experimental chambers were individually plumbed so that each had a constant flow of water. Crabs were initially weighed and these initial weights were used to determine the amount of food that they would receive. Crabs were randomly assigned to food treatments which crossed four levels of food amount (1, 2, 4, 8 % of body weight per day) and five levels of proportion of that food that was animal tissue or algae (all animal, 0.25 animal and 0.75 plant, 0.5 of each, 0.75 animal and 0.25 plant, all animal). The red alga Chondrus crispus was the plant material offered to crabs in this experiment and the animal tissue was Tilapia filets.

Crabs were fed twice per week (Monday and Thursday), and uneaten food was removed after 48 h, dried at 70 degrees C for 48 h, and weighed. At the conclusion of the experiment we dissected each crab and removed the ovaries and the hepatopancreas. We calculated the gonadosomatic index (GSI), or the proportion of body weight allocated to the ovaries, and the hepatosomatic index (HSI), or the proportion of body weight allocated to the hepatopancreas.

Data Processing Description

Raw data are presented.

BCO-DMO Processing:
- added conventional header with dataset name, PI name, version date, reference information
- renamed parameters to BCO-DMO standard
- added site, lat, lon columns

Parameters

Parameter	Description	Units
site	specimen collection location	unitless
lat	latitude; north is positive	decimal degrees
lon	longitude; east is positive	decimal degrees
crab	unique identifying number for each crab	unitless
AlgaeOffered	amount of algae offered to crab at each feeding	grams
FishOffered	amount of fish offered to crab at each feeding	grams
AlgaeEaten	average amount consumed from each feeding	grams
FishEaten	average amount consumed from each feeding	grams
CarapaceColor	color of carapace	unitless
carap_width	carapace width of crab	millimeters
Gravid	was crab gravid at end of experiment (yes=1; no=0)	unitless
gut_width	width of gut in millimeters	millimeters
MissingLegsMass	calculated mass of missing legs based on allometric relationship for each leg for this species	grams
mass_body_final	total body mass of crab at end of experiment	grams
PriorEggs	Mass of egg clutch produced during the experiment	grams
HIS	hepatosomatic index (hepatopancreas mass divided by body mass)	unitless
GSI	gonadosomatic index (ovary mass divided by body mass)	unitless
Molted	crab molted during experiment (yes=1; no=0)	unitless
ReproducedDuringExpt	crab produced clutch of eggs during experiment (yes=1; no=0)	unitless
DaysSinceMolt	Number of days between time molted and end of experiment	days
DaysSinceReproduce	number of days between time produced clutch of eggs and end of experiment	days
Assimilation	average assimilation efficiency of consumed food calculated by dividing mass of feces produced by the mass of food consumed at each feeding	unitless

Project Information

Linking Variation in Metabolic Processes as a Key to Prediction (Variation in Metabolic Processes)

Description from NSF award abstract:
A major goal of biological and ecological sciences is to understand natural systems well enough to predict how species and populations will respond to a rapidly changing world (i.e., climate change, habitat loss, etc.). A population under any conditions will grow, shrink, or disappear altogether depending on how efficiently individuals consume resources (food), utilize that food metabolically, and eventually reproduce. However, making accurate predictions based on these metabolic processes is complicated by the realities that each species has different resource requirements and that no two individuals within a species are exactly alike. Rather, individuals vary and this variation, both within and across species, is central to many ecological and evolutionary processes. Developing the ability to predict responses of biological systems to a changing world therefore requires a mechanistic understanding of variation. The goal of this project is to improve this mechanistic understanding by examining variation within a metabolic context across a range of species that have a spectrum of commonly-seen resource requirements. Further, the work capitalizes on a unique biological characteristic of this group of species that allows control and manipulation of individual reproduction, facilitating experimental study of the mechanistic links between variation in individual consumption, metabolism, and reproduction. The foundation this research is a combination of field measurements and laboratory experiments using both well-established and newly-developed techniques to quantify these links. The result will be a quantitative framework to predict how individuals will respond reproductively to changes in resource use. Because of the close link between individual reproduction and population dynamics, this research will contribute substantially to predictions in population dynamics under realistic conditions where individuals use more than a single resource, and improve the prediction of responses to current and future ecological changes.

The following publications and data resulted from this project:

Belgrad, B. and B. Griffen. 2016. Predator-prey interactions mediated by prey personality and predator identity.*Proc. Roy. Soc. B*: In Review. [2016-01-20]
P. herbstii mortality data: Mortality of crabs when exposed to either a single blue crab, toadfish, or no predator for a week
P. herbstii personality data: Refuge use of crabs when exposed to predator odor cues from either blue crabs, toadfish, or control of no cue
P. herbstii predator behavior data: Refuge use and mobility of blue crabs and toadfish while in mesocosms for a week - behavior measured during two days.

Belgrad, B. and B. Griffen. 2016. The influence of dietary shifts on fitness of the blue crab, *Callinectes sapidus*. *PloS One. DOI: 10.1371/journal.pone.0145481*.
Blue crab activity: Activity of crabs fed different diets over a summer
Blue crab egg size: Volume of eggs for crabs fed different diets
Blue crab hepatopancreas index (HSI): Weight of hepatopancreas for crabs fed different diets
Blue crab hepatopancreas lipid content: Hepatopancreas lipid content of crabs fed different diets
Blue crab reproductive tissue analysis (GSI): Gonadosomatic index of blue crabs on various diets
Blue crab survival: Blue crab survival data during the dietary study
