Coverage

Spatial Extent: N:10.544984 **E**:-158.320979 **S**:-26.364655 **W**:-179.289931 **Temporal Extent**: 2016-01-16 - 2016-02-11

Dataset Description

These CTD data were originally served by R2R and can be accessed here: doi.org/10.7284/121562

CTD data collected during research cruise FK160115 using a Sea-Bird SBE-911+ instrument system onboard the platform RV Falkor.

Location: Tropical/equatorial Pacific along 150 deg W; Honolulu, Hawai'i to Pape'ete, French Polynesia

Methods & Sampling

Underway CTD (Conductivity, Temperature, Depth) data collected during research cruise FK160115 using a Sea-Bird SBE-911+ instrument system onboard the platform RV Falkor.

BCO-DMO Data Processing Notes:

- Data a served as they appear in the R2R catalog.

Instruments

Dataset- specific Instrument Name	SeaBird SBE19 CTD
Generic Instrument Name	CTD Sea-Bird
Dataset- specific Description	Used for water sampling
Generic Instrument Description	Conductivity, Temperature, Depth (CTD) sensor package from SeaBird Electronics, no specific unit identified. This instrument designation is used when specific make and model are not known. See also other SeaBird instruments listed under CTD. More information from Sea-Bird Electronics.

Project Information

The ProteOMZ Expedition: Investigating Life Without Oxygen in the Pacific Ocean (ProteOMZ (Proteomics in an Oxygen Minimum Zone))

Website: <u>https://schmidtocean.org/cruise/investigating-life-without-oxygen-in-the-tropical-pacific/#team</u>

Coverage: Central Pacific Ocean (Hawaii to Tahiti)

From Schmidt Ocean Institute's ProteOMZ Project page:

Rising temperatures, ocean acidification, and overfishing have now gained widespread notoriety as humancaused phenomena that are changing our seas. In recent years, scientists have increasingly recognized that there is yet another ingredient in that deleterious mix: a process called deoxygenation that results in less oxygen available in our seas.

Large-scale ocean circulation naturally results in low-oxygen areas of the ocean called oxygen deficient zones (ODZs). The cycling of carbon and nutrients – the foundation of marine life, called biogeochemistry – is fundamentally different in ODZs than in oxygen-rich areas. Because researchers think deoxygenation will greatly expand the total area of ODZs over the next 100 years, studying how these areas function now is important in predicting and understanding the oceans of the future. This first expedition of 2016 led by Dr. Mak Saito from the Woods Hole Oceanographic Institution (WHOI) along with scientists from University of Maryland Center for Environmental Science, University of California Santa Cruz, and University of Washington aimed to do just that, investigate ODZs.

During the 28 day voyage named "ProteOMZ," researchers aboard R/V *Falkor* traveled from Honolulu, Hawaii to Tahiti to describe the biogeochemical processes that occur within this particular swath of the ocean's ODZs. By doing so, they contributed to our greater understanding of ODZs, gathered a database of baseline measurements to which future measurements can be compared, and established a new methodology that could be used in future research on these expanding ODZs.
