Dataset Description

Community level incubations. Data generated from an experimental coral reef community from Mo'orea, French Polynesia. Results are published in:

Lantz CA, Carpenter RC, Comeau S, Edmunds PJ. Organisms Composing an Experimental Coral Reef Community from Mo'orea, French Polynesia, Exhibit Taxon-Specific Net Production: Net Calcification Ratios. *Frontiers in Marine Science*. 2017; 4(298). doi: <http://doi.org/10.3389/fmars.2017.00298>

Please see publication for complete methodology.

Seawater samples were taken from each community and chamber at the beginning and end of each 3-h incubation (09:00 -12:00 hrs) and analyzed for temperature, salinity, total alkalinity (TA), and pH. Temperature was measured using a ThermoFisher Scientific Traceable Thermometer (± 0.01 °C) and salinity was measured using a conductivity meter (YSI 3100). Measurements of TA were made within 24 h of collection of seawater samples using open-cell potentiometric titrations (Dickson et al., 2007) on a Mettler Toledo T-50 titrator fitted with a DG115 pH electrode, and analyses were completed in duplicate using 50 mL seawater samples. Measurements of pH were performed using a spectrophotometric procedure with m-cresol dye, and calculated on the Total Scale (pH_T).

Values for dissolved inorganic carbon (DIC) were calculated from the measured TA, pH_T, salinity, and temperature using the R package seacarb (Lavigne and Gattuso, 2013). Net production (P , mmol C m⁻² h⁻¹) and net calcification (G , mmol CaCO₃ m⁻² h⁻¹), were calculated from changes in DIC (Δ DIC) and TA (Δ TA) using equations from Gattuso et al. (1996). The ratio of P/G (mmol C mmol CaCO₃⁻¹), for both the community and each individual community member, was calculated by dividing each day's measured P by the

contemporaneously measured G (P/G_{ratio}). The slope of P regressed on G ($\text{mmol C mmol CaCO}_3^{-1}$), for both the community and each individual community member, was calculated from a best fit type II sum of squares residual model, in which all measures of P over the course of the study were regressed on G for the respective community (P/G_{slope}), or individual community members. Statistical analyses were performed with SPSS software (SPSS Inc. Version 22.0) running in a Windows environment, and the assumptions of normality and equality of variance were evaluated with graphical analyses of the residuals

Parameters

Parameter	Description	Units
incubation_number	Incubation number	no units
community	Community number	no units
date_start	Date at beginning of incubation; yyyy-mm-dd	no units
date_end	Date at end of incubation; yyyy-mm-dd	no units
time_start	Time at beginning of incubation; hh:mm	no units
time_end	Time at end of incubation; hh:mm	no units
temp_start	Temperature at beginning of incubation	degrees Celsius
temp_end	Temperature at end of incubation	degrees Celsius
sal_start	Salinity at beginning of incubation	psu
sal_end	Salinity at end of incubation	psu
spec_pH_start	pH value from spectrophotometric measurements at the beginning of incubation	pH scale

spec_pH_end	pH value from spectrophotometric measurements at the end of incubation	pH scale
in_situ_pH_start	pH value recalculated from spectrophotometric measurements to account for the in-situ temperature at the start of the incubation	pH scale
in_situ_pH_end	pH value recalculated from spectrophotometric measurements to account for the in-situ temperature at the end of the incubation	pH scale
TA_start	Total alkalinity at the beginning of the incubation	umol/kg
TA_end	Total alkalinity at the end of the incubation	umol/kg
DIC_start	DIC at the beginning of the incubation	umol/kg
DIC_end	DIC at the end of the incubation	umol/kg
P_calc	Calculated rate of net photosynthesis (referred to as production in the paper)	mmol/m2/hr
G_calc	Calculated rate of net calcification	mmol/m2/hr

Project Information

Collaborative Research: Ocean Acidification and Coral Reefs: Scale Dependence and Adaptive Capacity (OA coral adaptation)

Website: <http://mcr.lternet.edu>

Coverage: Moorea, French Polynesia

Extracted from the NSF award abstract:

This project focuses on the most serious threat to marine ecosystems, Ocean Acidification (OA), and addresses the problem in the most diverse and beautiful ecosystem on the planet, coral reefs. The research utilizes Moorea, French Polynesia as a model system, and builds from the NSF investment in the Moorea Coral Reef Long Term Ecological Research Site (LTER) to exploit physical and biological monitoring of coral reefs as a context for a program of studies focused on the ways in which OA will affect corals, calcified algae, and coral reef ecosystems. The project builds on a four-year NSF award with research in five new directions: (1) experiments of year-long duration, (2) studies of coral reefs to 20-m depth, (3) experiments in which carbon dioxide will be administered to plots of coral reef underwater, (4) measurements of the capacity of coral reef organisms to change through evolutionary and induced responses to improve their resistance to OA, and (5) application of emerging theories to couple studies of individual organisms to studies of whole coral reefs. Broader impacts will accrue through a better understanding of the ways in which OA will affect coral reefs that are the poster child for demonstrating climate change effects in the marine environment, and which provide income, food, and coastal protection to millions of people living in coastal areas, including in the United States.

This project focuses on the effects of Ocean Acidification on tropical coral reefs and builds on a program of research results from an existing 4-year award, and closely interfaces with the technical, hardware, and information infrastructure provided through the Moorea Coral Reef (MCR) LTER. The MCR-LTER, provides an unparalleled opportunity to partner with a study of OA effects on a coral reef with a location that arguably is better instrumented and studied in more ecological detail than any other coral reef in the world. Therefore, the results can be both contextualized by a high degree of ecological and physical relevance, and readily integrated into emerging theory seeking to predict the structure and function of coral reefs in warmer and more acidic future oceans. The existing award has involved a program of study in Moorea that has focused mostly on short-term organismic and ecological responses of corals and calcified algae, experiments conducted in mesocosms and flumes, and measurements of reef-scale calcification. This new award involves three new technical advances: for the first time, experiments will be conducted of year-long duration in replicate outdoor flumes; CO₂ treatments will be administered to fully intact reef ecosystems in situ using replicated underwater flumes; and replicated common garden cultivation techniques will be used to explore within-species genetic variation in the response to OA conditions. Together, these tools will be used to support research on corals and calcified algae in three thematic areas: (1) tests for long-term (1 year) effects of OA on growth, performance, and fitness, (2) tests for depth-dependent effects of OA on reef communities at 20-m depth where light regimes are attenuated compared to shallow water, and (3) tests for beneficial responses to OA through intrinsic, within-species genetic variability and phenotypic plasticity. Some of the key experiments in these thematic areas will be designed to exploit integral projection models (IPMs) to couple organism with community responses, and to support the use of the metabolic theory of ecology (MTE) to address scale-dependence of OA effects on coral reef organisms and the function of the communities they build.

Program Information

Science, Engineering and Education for Sustainability NSF-Wide Investment (SEES): Ocean Acidification (formerly CRI-OA) (SEES-OA)

Website: https://www.nsf.gov/funding/pgm_summ.jsp?pims_id=503477

Coverage: global

NSF Climate Research Investment (CRI) activities that were initiated in 2010 are now included under Science, Engineering and Education for Sustainability NSF-Wide Investment (SEES). SEES is a portfolio of activities that highlights NSF's unique role in helping society address the challenge(s) of achieving sustainability. Detailed information about the SEES program is available from NSF (https://www.nsf.gov/funding/pgm_summ.jsp?pims_id=504707).

In recognition of the need for basic research concerning the nature, extent and impact of ocean acidification

on oceanic environments in the past, present and future, the goal of the SEES: OA program is to understand (a) the chemistry and physical chemistry of ocean acidification; (b) how ocean acidification interacts with processes at the organismal level; and (c) how the earth system history informs our understanding of the effects of ocean acidification on the present day and future ocean.

Solicitations issued under this program:
