## Abstract

Partial pressure of carbon dioxide (pCO<sub>2</sub>) from in-situ flume experiments to manipulate pCO<sub>2</sub> on shallow tropical coral reef communities at UCB Gump Research Station Moorea, French Polynesia in May of 2018. These data are for a proof of trial experiment for the Shallow CORal REef Free Ocean Carbon Enrichment (SCORE FOCE), outlined in Srednick et al. (2020).

**Temporal Extent:** 2018-05-09 - 2018-05-11

## Dataset Description

Partial pressure of carbon dioxide (pCO<sub>2</sub>) from in-situ flume experiments to manipulate pCO<sub>2</sub> on shallow tropical coral reef communities at UCB Gump Research Station Moorea, French Polynesia in May of 2018. These data are for a proof of trial experiment for the Shallow CORal REef Free Ocean Carbon Enrichment (SCORE FOCE), outlined in Srednick et al. (2020).

Related datasets (all from the same in-situ flume experiment):

Srednick et al. 2020 - L&O Methods - DO: <https://www.bco-dmo.org/dataset/812927>

## Methods & Sampling

Seawater pCO<sub>2</sub> was calculated from TA, pH, salinity, and temperature using the R package seacarb (Lavigne and Gattuso, 2013).

Data sources used for calculations:

TA and salinity from "Srednick et al. 2020 - L&O Methods - TA, SAL" <https://www.bco-dmo.org/dataset/812891>

pH from "Srednick et al. 2020 - L&O Methods - pH seafet" <https://www.bco-dmo.org/dataset/812864>

temperature from "Srednick et al. 2020 - L&O Methods - temperature" <https://www.bco-dmo.org/dataset/812873> "

The full methodology can be found in Srednick et al. (2020).

## Data Processing Description

Data were processed using seacarb, seawater carbonate chemistry, R package version 2. 4. 10 (Lavigne H and Gattuso, 2013).

BCO-DMO Data Manager Processing Notes:

\* Original data submitted as in Excel file L&O\_2019\_data.xlsx sheet "pCO<sub>2</sub>" extracted to csv.

\* added a conventional header with dataset name, PI name, version date

\* modified parameter names to conform with BCO-DMO naming conventions (spaces, +, and - changed to underscores). Units in parentheses removed and added to Parameter Description metadata section.

\* blank values in this dataset are displayed as "nd" for "no data." nd is the default missing data identifier in the BCO-DMO system.

\* Added ISO\_DateTime\_UTC column in ISO 8601 format yyyy-mm-ddTHH:MMZ from local date and time provided in local time, Tahiti, UTC-10.

## Instruments

<b>Dataset-specific Instrument Name</b>	Mettler Toledo T50
<b>Generic Instrument Name</b>	Automatic titrator
<b>Dataset-specific Description</b>	TA generated using a Mettler Toledo T50 fitted with a DG 115-SC electrode.
<b>Generic Instrument Description</b>	Instruments that incrementally add quantified aliquots of a reagent to a sample until the end-point of a chemical reaction is reached.

<b>Dataset-specific Instrument Name</b>	HOBO U22-001
<b>Generic Instrument Name</b>	Onset HOBO Pro v2 temperature logger
<b>Dataset-specific Description</b>	The temperature was measured with a Hobo Pro v2 ( $\pm 0.2$ °C), HOBO U22-001, Onset, Bourne, MA.
<b>Generic Instrument Description</b>	The HOBO Water Temp Pro v2 temperature logger, manufactured by Onset Computer Corporation, has 12-bit resolution and a precision sensor for $\pm 0.2$ °C accuracy over a wide temperature range. It is designed for extended deployment in fresh or salt water. Operation range: -40° to 70°C (-40° to 158°F) in air; maximum sustained temperature of 50°C (122°F) in water Accuracy: 0.2°C over 0° to 50°C (0.36°F over 32° to 122°F) Resolution: 0.02°C at 25°C (0.04°F at 77°F) Response time: (90%) 5 minutes in water; 12 minutes in air moving 2 m/sec (typical) Stability (drift): 0.1°C (0.18°F) per year Real-time clock: $\pm 1$ minute per month 0° to 50°C (32° to 122°F) Additional information ( <a href="http://www.onsetcomp.com/">http://www.onsetcomp.com/</a> ) Onset Computer Corporation 470 MacArthur Blvd Bourne, MA 02532

<b>Dataset-specific Instrument Name</b>	SeaFET pH sensor
<b>Generic Instrument Name</b>	pH Sensor
<b>Generic Instrument Description</b>	An instrument that measures the hydrogen ion activity in solutions. The overall concentration of hydrogen ions is inversely related to its pH. The pH scale ranges from 0 to 14 and indicates whether acidic (more H+) or basic (less H+).

<b>Dataset-specific Instrument Name</b>	conductivity cell
<b>Generic Instrument Name</b>	Salinity Sensor
<b>Dataset-specific Description</b>	Salinity of the samples was measured using a conductivity cell (Orion Star A212 conductivity meter, Thermo-Scientific, Waltham, MA).
<b>Generic Instrument Description</b>	Category of instrument that simultaneously measures electrical conductivity and temperature in the water column to provide temperature and salinity data.

## Project Information

### Moorea Coral Reef Long-Term Ecological Research site (MCR LTER)

**Website:** <http://mcr.lternet.edu/>

**Coverage:** Island of Moorea, French Polynesia

From <http://www.lternet.edu/sites/mcr/> and <http://mcr.lternet.edu/>:

The Moorea Coral Reef LTER site encompasses the coral reef complex that surrounds the island of Moorea, French Polynesia (17°30'S, 149°50'W). Moorea is a small, triangular volcanic island 20 km west of Tahiti in the Society Islands of French Polynesia. An offshore barrier reef forms a system of shallow (mean depth ~ 5-7 m), narrow (~0.8-1.5 km wide) lagoons around the 60 km perimeter of Moorea. All major coral reef types (e.g., fringing reef, lagoon patch reefs, back reef, barrier reef and fore reef) are present and

accessible by small boat.

The MCR LTER was established in 2004 by the US National Science Foundation (NSF) and is a partnership between the University of California Santa Barbara and California State University, Northridge. MCR researchers include marine scientists from the UC Santa Barbara, CSU Northridge, UC Davis, UC Santa Cruz, UC San Diego, CSU San Marcos, Duke University and the University of Hawaii. Field operations are conducted from the UC Berkeley Richard B. Gump South Pacific Research Station on the island of Moorea, French Polynesia.

**MCR LTER Data:** The Moorea Coral Reef (MCR) LTER data are managed by and available directly from the MCR project data site URL shown above. The datasets listed below were collected at or near the MCR LTER sampling locations, and funded by NSF OCE as ancillary projects related to the MCR LTER core research themes.

**This project is supported by continuing grants with slight name variations:**

LTER: Long-Term Dynamics of a Coral Reef Ecosystem  
LTER: MCR II - Long-Term Dynamics of a Coral Reef Ecosystem  
LTER: MCR IIB: Long-Term Dynamics of a Coral Reef Ecosystem  
LTER: MCR III: Long-Term Dynamics of a Coral Reef Ecosystem  
LTER: MCR IV: Long-Term Dynamics of a Coral Reef Ecosystem

**Collaborative Research: Ocean Acidification and Coral Reefs: Scale Dependence and Adaptive Capacity (OA coral adaptation)**

**Website:** <http://mcr.lternet.edu>

**Coverage:** Moorea, French Polynesia

*Extracted from the NSF award abstract:*

This project focuses on the most serious threat to marine ecosystems, Ocean Acidification (OA), and addresses the problem in the most diverse and beautiful ecosystem on the planet, coral reefs. The research utilizes Moorea, French Polynesia as a model system, and builds from the NSF investment in the Moorea Coral Reef Long Term Ecological Research Site (LTER) to exploit physical and biological monitoring of coral reefs as a context for a program of studies focused on the ways in which OA will affect corals, calcified algae, and coral reef ecosystems. The project builds on a four-year NSF award with research in five new directions: (1) experiments of year-long duration, (2) studies of coral reefs to 20-m depth, (3) experiments in which carbon dioxide will be administered to plots of coral reef underwater, (4) measurements of the capacity of coral reef organisms to change through evolutionary and induced responses to improve their resistance to OA, and (5) application of emerging theories to couple studies of individual organisms to studies of whole coral reefs. Broader impacts will accrue through a better understanding of the ways in which OA will affect coral reefs that are the poster child for demonstrating climate change effects in the marine environment, and which provide income, food, and coastal protection to millions of people living in coastal areas, including in the United States.

This project focuses on the effects of Ocean Acidification on tropical coral reefs and builds on a program of research results from an existing 4-year award, and closely interfaces with the technical, hardware, and information infrastructure provided through the Moorea Coral Reef (MCR) LTER. The MCR-LTER, provides an unparalleled opportunity to partner with a study of OA effects on a coral reef with a location that arguably is better instrumented and studied in more ecological detail than any other coral reef in the world. Therefore, the results can be both contextualized by a high degree of ecological and physical relevance, and readily integrated into emerging theory seeking to predict the structure and function of coral reefs in warmer and more acidic future oceans. The existing award has involved a program of study in Moorea that has focused mostly on short-term organismic and ecological responses of corals and calcified algae, experiments conducted in mesocosms and flumes, and measurements of reef-scale calcification. This new award involves three new technical advances: for the first time, experiments will be conducted of year-long duration in replicate outdoor flumes; CO2 treatments will be administered to fully intact reef ecosystems in situ using replicated underwater flumes; and replicated common garden cultivation techniques will be used to explore within-species genetic variation in the response to OA conditions. Together, these tools will be used to support research on corals and calcified algae in three thematic areas: (1) tests for long-term (1 year) effects of OA on growth, performance, and fitness, (2) tests for depth-dependent effects of OA on reef communities at 20-m depth where light regimes are attenuated compared to shallow water, and (3) tests for beneficial responses to OA through intrinsic, within-species genetic variability and phenotypic plasticity. Some of the key experiments in these thematic areas will be designed to exploit integral projection models (IPMs) to couple organism with community responses, and to support the use of the metabolic theory of ecology (MTE) to address scale-dependence of OA effects on coral reef organisms and the function of the communities they build.

## Program Information

### Long Term Ecological Research network (LTER)

**Website:** <http://www.lternet.edu/>

**Coverage:** United States

**adapted from** <http://www.lternet.edu/>

The National Science Foundation established the LTER program in 1980 to support research on long-term ecological phenomena in the United States. The Long Term Ecological Research (LTER) Network is a collaborative effort involving more than 1800 scientists and students investigating ecological processes over long temporal and broad spatial scales. The LTER Network promotes synthesis and comparative research across sites and ecosystems and among other related national and international research programs. The LTER research sites represent diverse ecosystems with emphasis on different research themes, and cross-site communication, network publications, and research-planning activities are coordinated through the LTER Network Office.

### Science, Engineering and Education for Sustainability NSF-Wide Investment (SEES): Ocean Acidification (formerly CRI-OA) (SEES-OA)

**Website:** [https://www.nsf.gov/funding/pgm\\_summ.jsp?pims\\_id=503477](https://www.nsf.gov/funding/pgm_summ.jsp?pims_id=503477)

**Coverage:** global

NSF Climate Research Investment (CRI) activities that were initiated in 2010 are now included under Science, Engineering and Education for Sustainability NSF-Wide Investment (SEES). SEES is a portfolio of activities that highlights NSF's unique role in helping society address the challenge(s) of achieving sustainability. Detailed information about the SEES program is available from NSF ([https://www.nsf.gov/funding/pgm\\_summ.jsp?pims\\_id=504707](https://www.nsf.gov/funding/pgm_summ.jsp?pims_id=504707)).

In recognition of the need for basic research concerning the nature, extent and impact of ocean acidification on oceanic environments in the past, present and future, the goal of the SEES: OA program is to understand (a) the chemistry and physical chemistry of ocean acidification; (b) how ocean acidification interacts with processes at the organismal level; and (c) how the earth system history informs our understanding of the effects of ocean acidification on the present day and future ocean.
